Farm Facts

The word "corn" is used to describe the cereal that may happen to be the major crop in an area. In England, for example, it refers to wheat. In other countries it may mean barley or oats.

Corn, as we know it in this country, originated in the Americas and was unknown elsewhere until Columbus reported its discovery in Cuba. Now scientists, through the use of radioactive carbon to measure the age of vegetation, have established that corn was being grown in South America as far back as 1000 B.C. and in North America in 2000 B.C.

The Mayas, Aztecs, and Incas of Latin America cultivated corn and it was a staple item in their diet. It was grown by the mound dwellers in the Mississippi Valley and the cliff dwellers of the Southwest.

Popularity of the grain spread rapidly after it became known in Europe, and today corn is found all over the world. In acreage planted it ranks second only to wheat.

America is the home of corn.

It grows equally well in Canada, Russia, and in the tropical climates of South America. Corn is being harvested somewhere every month in the year. The U.S., however, produces more than half the world's crop.
