6 WAYS TO CONSERVE AND SAVE

ON WATER HEATERS

Normally the quantity of Hot water used in a household is about 1/4 to 1/3 of the total water usage. Here are some suggestions that can help you get the most out of your water heater.

With a little planning, you can arrange to wash only full loads of clothing in your washer and full loads of dishes in your dishwasher. Less than full loads consumes energy and wastes water needlessly.

2. To assure long life and efficiency, the water heater tank should have a small amount of water drained periodically. Once a month should be adequate. The purpose of draining water from the tank is to prevent sediment build-up in the tank bottom.

3. A water heater that's old, or too small for your family needs, can be wasteful because it's working too hard and using too much energy to keep up with your hot water demands.

4. It's amazing how much water a leaky faucet will drip in a month's time and if the leaking faucet is a hot water faucet, it will waste both energy and water needlessly. As an example, a faucet dripping 90 drops per minute, will waste 300 gallons per month.

5. The thermostat controlling the water temperature is pre-set at the factory to deliver hot water at 150°F. This setting has proven most satisfactory from the standpoint of operating cost and household needs.

6. The thermostat can be adjusted to provide warmer or cooler water temperatures. The thermostats are clearly marked for easy adjustment to increase or decrease the water temperature.
