Cotton Diseases Are Slowing Up  

Verticillium wilt has been a problem in cotton in the lower Coastal Bend and along the Texas Gulf Coast. As a result, the 1966 cotton crop is expected to be lower than normal. The disease is caused by a fungus that attacks the roots and stems of cotton plants. The symptoms include stunted growth, yellowing of leaves, and a general decline in the health of the plant. The disease is spread by wind and rain, and can be controlled by the use of resistant varieties and proper cultivation practices. The disease is particularly prevalent in areas with a high rainfall and warm temperatures.
