WASHINGTON AND **"SMALL BUSINESS"** By C. WILSON HARDER

In view of the concerted drive still underway to abolish the Re-construction Finance Corporation, it is interesting to note the report just issued by Telford Taylor, head of the Small Defense Plants Corporation.

In its second quarter of existence, the

agency aided 400 small concerns secure needed controlled materials to handle defense contracts. In addition, 30 small companies re-

\$2,500,000 to carry out defense contracts. Thus the loans for a three month period were less than the United States gives away to European nations before noon on a slow day.

The Small Defense Plants Corporation report emphasizes much needs to be done to secure a fairer share of defense work for small firms.

In 1950, the report states, small firms received 24.5% of all prime military contracts, dropping to 20.9% in 1951, and to 19.8% in 1952 so far. However, the report indicates progress is being made to further aid small business by reversing this trend.

Against this report of constructive efforts, it is interesting to compare one week's report of the Office of Price Stabilization, the OPS, or Office Plenty Screwy.

* * * Proudly, the Office Plenty Screwy announces in a press release that for the second consecutive week civil actions filed in U.S. Courts all through the land for damages exceed a million dollars. CNational Federation of Independent Busines

When names are named, they are all small firms. OPS reports 36 cases were settled for \$77,000 damages because no apparent wilful violations existed.

But in 38 cases, where apparently wilful violation was a lleged, damages collected amounted to only \$11,000. Thus, it appears that OPS is able to scare small business into bigger damages than it can win in expensive court actions.

* * * For example, one small busi-ness man in Atlanta, Georgia, engaged in the rental and service of burglar alarms, was recently cited for raising monthly service fees to \$5 to all customers who were not paying that much. This, the OPS says, is a violation, and OPS wants treble damages totalling \$2,739. 30 for alleged overcharges, totalling \$913.12 in six months.

. . . Some cynics explain this action with the remark, "Anybody like the Office Plenty Screwy engaged in dipping into other people's pockets, can be expected to have a natural aversion toward anything to do with burglar alarms.

* * * The OPS is also anxious to keep liquor prices down. In Connecticut, the Office Plenty Screwy has filed charges against seven liquor dealers for selling above OPS ceilings.

* * * The dealers were ordered by the Connecticut Liquor Control Commission which controls state liquor prices, to increase their prices, or run afoul of state law. Therefore, no matter what they did, these dealers faced court action. It is said behind the Iron Curtain some people are often permitted to choose between the salt mines in Siberia and the salt mines in Poland.

Ladino Clover Most Valuable Pasture Legume

Oregon State College Ladino Clover with Suitable Grass Combination Makes Excellent Pasture for Cattle, Hogs or Poultry.

The name "Ladino Clover" has | soil and climatic requirements as come to be synonymous with superior quality in pasture legumes. In production, palatability, high pervitamins, low percentage of fiber, low seed requirements per acre, long productive life, nitrogen fixa-tion, usefulness for pasture, silage, and hay, compatability in the field with all pasture grasses and other legumes under intelligent manage-ment, quick recovery after drought, grazing or cutting, and in every oth-er way over the large area to which it is adapted, Ladino clover is equal or superior to any other pasture

The phenomenal extension of Ladino clover across the continent from the valleys of Oregon and California east to the New England and the North Atlantic States, and from Minnesota, New York, and Canada on the north, to Texas, Louisiana, and Georgia on the south, gives am-ple evidence of its rapid rise in popularity, which rivals the advance of corn hybrids.

Ladino clover is rapidly becoming the foundation of an intensive grassland agriculture over a large part of the United States. Its culture and soil requirements in some respects are more exacting than those of common white clover, and its seed habits are not so good, but its general adaptation and its many important characteristics give it a dominant position as a pesture crop. Its low fiber content makes it especially valuable for hogs and poultry. Although primarily a graz-ing crop, Ladino clover is being used also for hay and silage, par ticularly combinations grasses and other legumes, and also as a cover crop.

Ladino clover is a large type of white clover with the same general tary stands or seeding. habits of growth as the common of the soil, climate, and manage low growing type found in our close-

usually recovers if given proper fer-tilization, proper grazing or cutting management, and compatible grass association.

Ladino clover may be sown alone or with grasses and other legumes, with or without a companion grain crop. When sown alone, one or two pounds of seed, or at most three pounds per arre is adequate, pro-vided the seedbed has been thor-oughly prepared and the sowing properly done. Heavier rates of sowing are often recommended, but are not necessary for most purposes. If sown in combination with other legumes or grasses, one-half pound per acre will usually give a good stand of Ladino, but one pound is more often recommended.

Mixtures of grasses with Ladino clover have been very satisfactory. In fact, except for seed production and specialized grazing it should be sown with one or more grasses and perhaps another legume. The La-dino serves to increase palatability, nutritive value and total yield of forage.

Like alfalfa and many other legumes, the high production poten-tiality of Ladino clover indicates that it requires large quantities of available mineral plant nutrients. The addition of substantial quantiies of phosphates, calcium, and potash is necessary for satisfactory plant growth.

The productive life of a field of adino clover and grass may range rom three to seven years, dependng upon the fertilization and management practices, diseases, and the rate of encroachment of Ken-tucky bluegrass from either volun-

For advice as to methods of culfleshy stems that root at the nodes. Depending upon the favorableness your local conditions, consult your ment, the leaves, stems, and flower heads of Ladino clover grow from 3 to 5 times as large as those of the supplier, county agent, able from common white clover and practically all seedsmen handle d, it is desirable that

PLANT PROPERLY TREATED COTTONSEED

The chance for a good stand of cotton with the first planting can be increased greatly when seed that has been treated properly with a recommended seed disinfectant is planted.

The circles in the picture above illustrate the difference seed treating may make. Treated seed and seedlings are less apt to suffer from seed decay, damping-off or sore-shin.

The small cost of treating is unimportant when compared with the expense of soil preparation, fertilizers, labor and equipment needed to produce a good crop. Less than 10c per acre spent for seed protection can often mean many dollars profit when the crop is brought to the gin. For information about treating your seed and the name of the cotton-

seed treater nearest you consult your county agricultural agent.

Ladino clover has about the same presented seed be used.

Be Sure to Use Right Fertilizer for Each Crop

The greatest quantity increases were in the South Central, South Atlantic, and East North Central reg. ns, in each of which over two n. llion tons more fertilizer were used in 1949 than in 1939. The greatest percentage increase was in the W-st North Central region, which used more than 11 times as much. $\mathfrak{T} \lor o$ states of that region—Iowa and Minnesota—together doubled this in. rease by using 22 times the quan-

With this great increase in the use of fertilizer in our important farm areas, it behooves the farm-ers of the United States to be sure ust they make the proper and best possible use of this fertilizer. Even mese figures giving increase in tonnage don't tell the whole story be-cause of the increased percentage of plant nutrients in each ton of fertilizer during this period, so that instead of 2-1/7 times as much it is more nearly 21/2 times in effectiveness.

We need to make sure that we know when to use fertilizers, how to apply them, and what the fer-tilizer needs of our soils and crops We need to know and underare. stand commercial fertilizers if we are to get all that we can from our fertilizer dollars, as well as from our seed dollars and the dollars used in other ways to improve our crop yields.

Most farmers know that commer-cial fertilizers are not a substitute for the use of lime, contouring, seed of high quality and of the right vari-ety, manure, and good crop rotations. Instead of being a replace-ment, commercial fertilizer is a supplement to manure and soil-building crops such as clovers and elfait where there are a supplement to manure and soil-building crops such as clovers and then make the best use of commercial fertilizer.

For every ton of commercial fer-Lilizer that farmers of the United States used in 1939 they used in 149, eleven years later, 2-1/7 tons. tion for the crop and soil.

Three different major plant food lements are contained in commer cial fertilizers—nitrogen, phesphor-us, and potassium. All of these elements are found in the soil, but sometimes there is too small an amount in an available form; that is, the plant cannot get enough for the best growth and yield. In that case we can often add commercial fertilizer of the right kind with profit. Each of the three ele-ments has a certain job to do in

producing the crop. One cannot sub-stitute for the other. No amount of hosphate added will correct a soil that is too low in potassium or nitrogen.

Just as soils differ greatly in appearance and productivity, so do they also differ in the kind of fertilizers they need. This is the main reason why the amounts and the grades of fertilizer used by farmers in different soil areas are so different.

In addition to the major differences in fertilizer needs among the general soil areas, the soils within any one soil area — even within a soil type — also differ markedly in their fertilizer needs, depending upon cropping history and general soil management practices used.

Fertilizer experiments cannot be carried out on every farm. In many cases, however, a farmer can make some fertilizer tests in a field by the use of broad strips of land differ-ently fertilized. Farmers can often be mutually helpful by participating in such simple tests.

alfaifa By tollowing these other economical fentilizer practice. Ark good soil-building practices, we can your county agent where to have such a test made, and how to take the sample.

If you've discovered how easy it is to dye bulky articles in your washing machine, you'll find these latest hints from the Tintex Home Economics Bureau of value in getting

even better results. To determine amount of dye needed, weigh article while dry and better not use the washer for items above $4\frac{1}{2}$ lbs.

Dissolve Dye in Quart Jar

come in man-made fibers or mixtures of natural and synthetic fibers

You'll need two boxes of 15¢ allfabric dye for articles of 12 ounces or less of light-colored cottons, linen, silk and viscose rayon — with twice the amount for dark colors. Articles made of nylon and acetate rayon need • little extra dye for lighter colors and up to three times the amount on the very darkest colors. If you to dyoing any fabric (alack, use sta 15¢ boxes for weights of 12 ounces or less. Weights above 12 ounces, of course, require proportionately more dye.

Let Machine Run Through Regular Wash Cycle and Set to Last Rinse

Always wash

ociore dyeir

a lighter shade

a lighter shade or an art.cle in any color to a different hue, or if the article is unevenly faded, stained or spotte l. Use a separate vessel for the color remover, since the washer requires so much water that it weakens the action of the property.

Employ the hottest water available in your chackine. It will pay you to pre-heat the machine by op-erating it for a few minutes and then draining the coster.

Water - Pour Dye into It Dissolve the dye in a quart jar or pitcher of very hot water, using a wooden stick or spoon to stir. If your Ē washer is automatic, pour the solution into the machine after enough water has come in to completely cover

When Washer is Filled with

the article. Then run the machine through the regular washing cycle (longer, if possible) and set to the last rinse After machine has com-pleted the rinse, either spin-dry or remove article and squeeze out water gently. Procedure for the wringer-type machine is the same, except that you'll have to stop the machine from time to time to see if article has been dyed to desired depth.

Remove Article and Gently Squeeze Out Excess Water

By no means should you wring dyed arti-cle either manually or in the machine. Just ALL F squeeze out excess water gently and hang article indoors or

in shade outdoors. Clean washer, after dyeing, by filling it with clean hot water and running it on the last rinse for automatic weshers or a short time for writter machines, using a smal amount of soap in both cases. Woolens should not be dyed in the washer because the action may "mat" the fibers. The washer is perfect, on the other hand, for Whitex, the whitening preparation

for yellowed white nylons, silks, rayons, linens, woolens and cottons. A leaflet giving details on dyeing in washers is available gratis at all-fabric dye counters, advises the Tintex bureau.

3. WHAT IS MALARIA

Answer to Question No. 1: present at birth, birth injuries The answer is definitely yes. In any mass screening when supposedly healthy individuals supposedly heathy individuals rapidly eradicating tham. Othhave X-ray pictures of their ers are beyond the control o lungs, a certain percentage of science.

Answer to Question No. 3: In these early stages tubercu-osis is curable. Inswer to Question No. 2: In 1900 about 20 of every 100 bables died before their first irtheay. In 1950 three out of ou died before taey were one ar eld. The chief causes of eath in these three are pre-inaturity, severe deformities

PLANT-- COTTON FOR

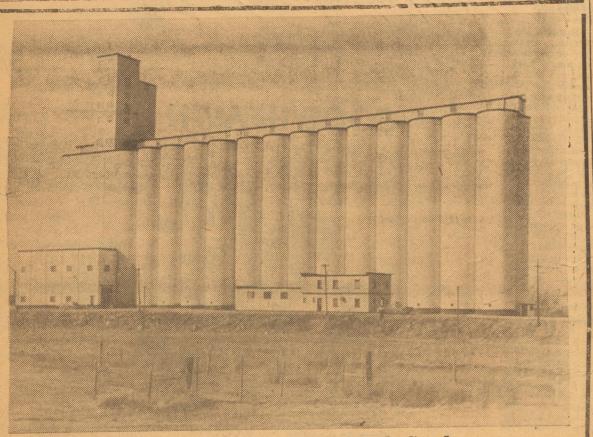

Now that we have adequate moisture, the Parmer County Cotton Improvement Association, made up of Cotton Growers desirous of increasing future Parmer County Allotments, respectfully urges each Parmer County Farmer to consider planting a reasonable portion of his land to Cotton this season

Here is Why:

- 1. Cotton is second only to steel as a national **Defense Commodity.**
- 2. Cotton fits a diversified farming program -- on either Dry or Irrigated land.
- 3. Cotton is essential to our balanced economy.
- 4. Parmer County has not had its share of the -- nation's cotton market.
- 5. Future controls and allotments are almost certain and any future allotments are likely to be based upon current acreages.

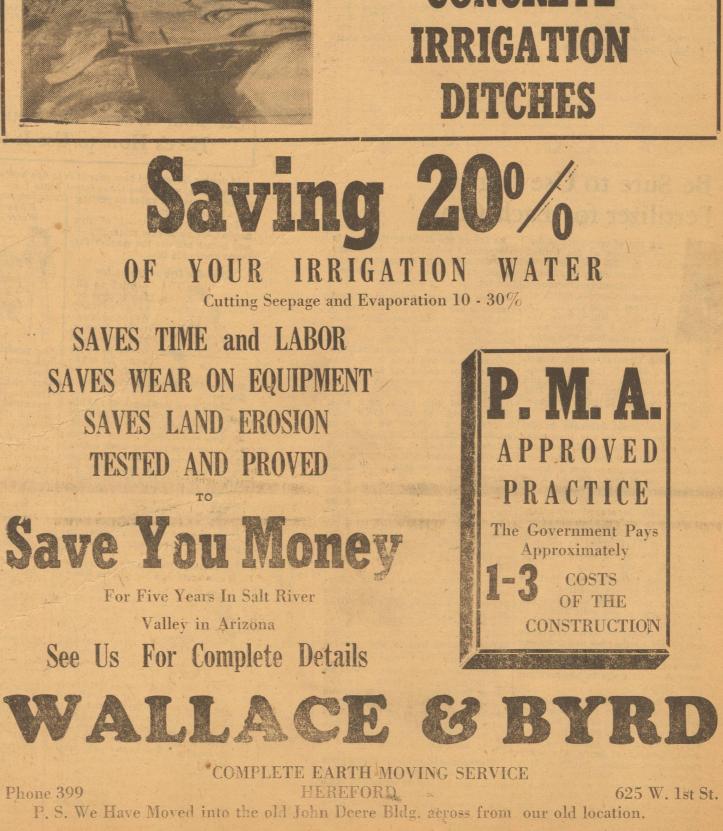

LET'S MAKE THIS A BANNER **YEAR-- FOR COTTON**

GREETINGS TO THE

COOKING SCHOOL and ELECTRIC APPLIANCE SHOW Sponsored by The Friona Star Friday at the School Auditorium

for instance there are the cooking schools, and Armed Forces Day observed last weekend to better acquaint the American people with the role of the serviceman, and there's Memorial Day coming up next week wherein we honor the war dead — the Local American Legion is conducting services at the park monument and at the cemetery we understand, and there's the graduation program this week

We take special note of these events and at the same time point out the role of the American banking system in enabling successful promotion of practically all these activities, assisting in a high standard of living and in a sound financial program for the individual.

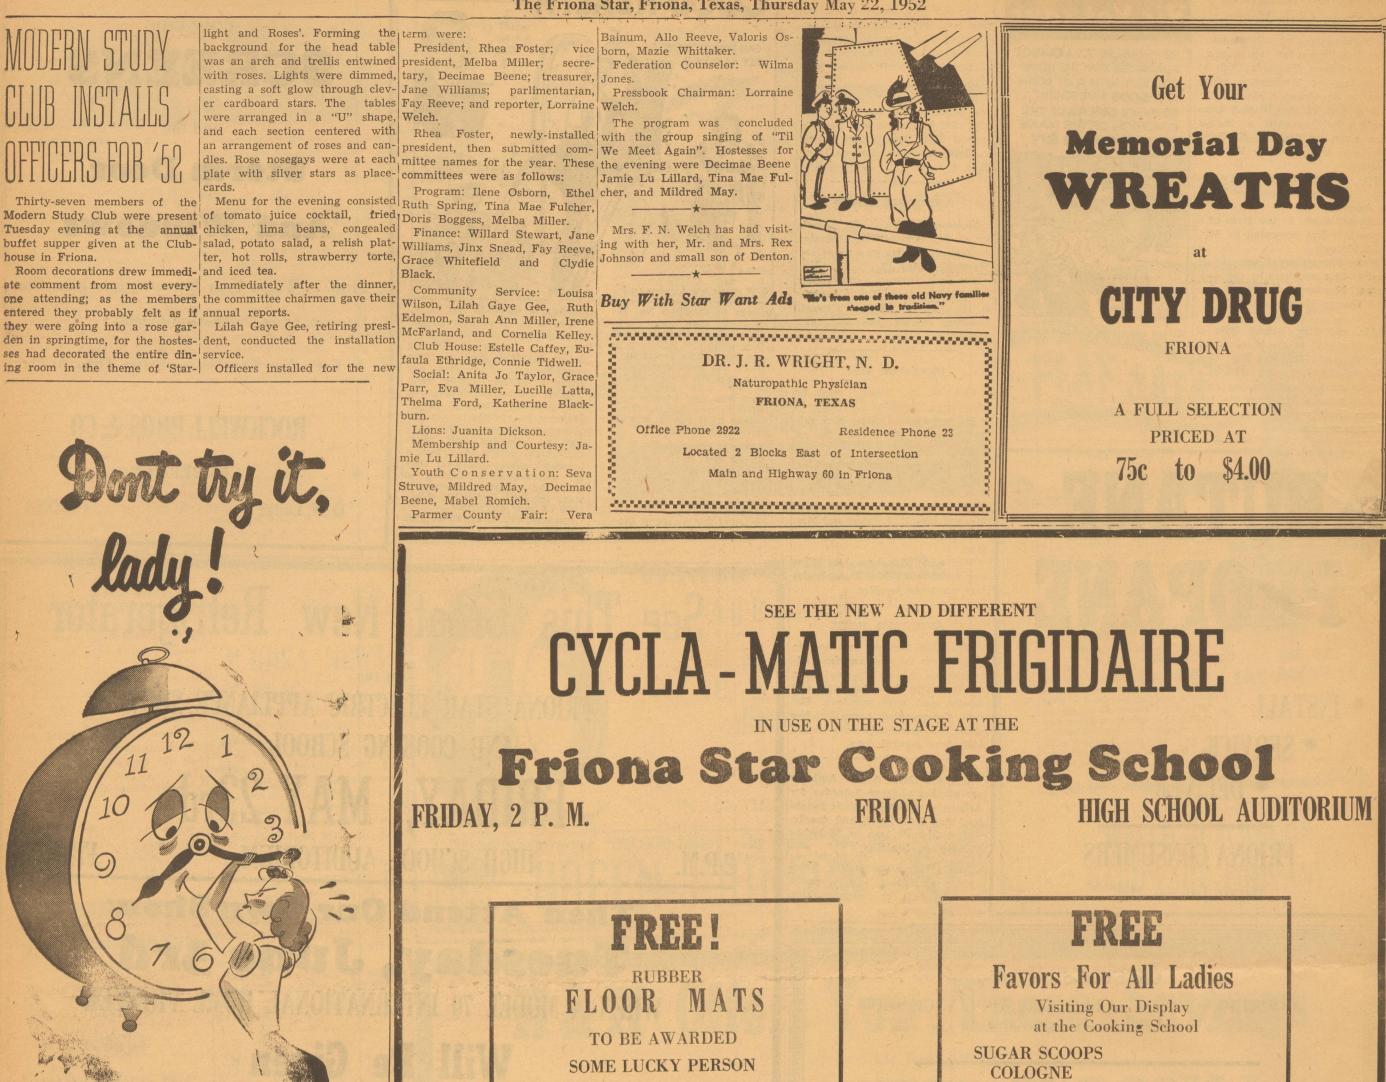

May we serve you in your own needs?
